

Abstract

The present invention relates to pharmaceutical compositions for the oral administration of phloroglucinol and to the preparation thereof. Characteristically, 5 said compositions:

- when liquid, contain a system which buffers them to a pH of between 3 and 7; or
- when solid, contain a system which, when they are placed in an aqueous medium, is capable of exerting a buffer effect between pH 3 and pH 7.

Said compositions advantageously consist of effervescent tablets.
